## Anti-colic baby bottles

### Almost half of all babies in the UK develop colic\*

There are two major problems associated with most traditional baby bottles: **air and vacuum**.

Traditional and restrictive vented bottles tend to develop vacuums because babies have to suck progressively harder on the one hole in the bottles to obtain the liquid. This causes teat collapse and baby has to stop feeding. Air enters the bottle when the teat re-inflates; this air is ingested and can cause colicky symptoms.

**78% of Healthcare Professionals agree that the most common cause of colic in young babies is caused by digestive or feeding problems, including swallowing air.\***

### But there is a solution...

The Dr Brown's® Options+™ baby bottles feature a unique system with a removable vent designed to create a 'vacuum free' environment.

Dr Brown's® has been trusted by parents and Healthcare Professionals around the world for over 20 years to reduce colic. The proven internal vent system continues to deliver vacuum-free feeding that keeps air out of baby's tummy.

### Internal vent system and silicone breast-like teat work together

The internal vent and silicone teat are highly engineered to provide a consistent milk flow. This provides a controlled flow so babies feed at their own pace.

**92% of UK Health Visitors recommend Dr Brown's® for the relief of colicky symptoms.\*\***

### Some parents find removing the vent a convenient option when:

**Baby's feeding has become more developed or want the convenience of a teat-vented bottle**

Options+™ grows with baby, allowing easy removal of the vent as baby develops, or no longer experiences feeding problems. Without the vent, Options+™ provides a feeding experience similar to most teat-vented bottles. This teat venting creates a controlled flow, offering babies an easy and convenient way to feed at their own pace.

### Two Vent Options. One Proven Bottle.

No need to introduce a different bottle once baby has grown out of colic.

### How does the Dr Brown's® Options+™ bottle work?

The anti-colic benefits of the internal vent system

## Health Benefits

### Internal Vent System

- 1 Air enters the bottle collar and routes directly through the internal vent system.
- 2 The air channels through the vent tube, bypassing the milk, to the end of the bottle.
- 3 The vent prevents aeration of the milk, vacuum pressure and teat collapse.
- 4 Baby feeds comfortably while milk flows freely, like breastfeeding.

### Teat Venting

Air enters through the vents at the base of the teat, creating a controlled flow.

**Dr Brown's® Options+™ Teat features a new, breast-like design to encourage natural feeding behaviour.**

Borrowed from nature, the correctly contoured design helps breastfeeding baby comfortably latch and avoid teat confusion.

**92% of UK Health Visitors recommend Dr Brown's® for the relief of colicky symptoms.\*\***
